

# AC Generation

---

&

**UNIVERSITY  
CENTRE**

# Core Principles

---

- AC generation relies on Faraday's law of induction
- They do this by rotating a magnet with coils of wires around it
- As the magnet rotates fluctuating currents are formed in the coils

$$\circ \varepsilon = -N \frac{\Delta\phi}{\Delta t}$$

◦ Where:

- $\varepsilon$  -> induced voltage
- $-N$  -> number of loops
- $\Delta\phi$  -> change in magnetic flux
- $\Delta t$  -> change in time

# Single vs Poly Phase AC Generation

- The number of phases you get from an AC generator is dependant on the number of coils the generator uses
- They most commonly are single or three phase

**Single-Phase**  
AC Generator  
(simplified)

**Three-Phase**  
AC Generator  
(simplified)

# Rotational to Electricity

---

- AC power is generated when the magnet in the system is rotated
- Often this rotation happens due to a turbine spinning
- The turbine will be turned by many different sources including wind, water, gas and steam
- Steam is the most used as it's easy to generate by boiling water
